1. INTRODUCTION

Higher education is a continuation of secondary education held to prepare learners to become members of the community who have academic and professional skills that can apply, develop and create science, technology and art. At this time the development of universities in Bali is very rapid, along with the increasing needs in the world of work that requires experts in their respective fields.

The community in general and the students who graduated from high school / vocational school / equivalent in particular, desperately need effective and efficient information in obtaining information about the university on the island of Bali and no doubt to place his choice in accordance with the interests and abilities in a particular field of knowledge. Therefore it is necessary to build an application of geographic information system of the spread of this college that can help the community or graduate high school students / vocational / equivalent who just completed their

education and want to continue education to a higher level again.

Geographic Information System (GIS) can provide information effectively in determining universities based on the areas of knowledge that are in demand by the community. During this time the public difficulty in obtaining information because of the possibility of too many universities in Bali are scattered in some areas and the possible lack of socialization of each college about the program offered. Therefore, this system can be a decision-making system for the community in general and graduates of high school / vocational school / equivalent in particular, to determine the choice of universities in accordance with their interests.

2. LITERATURE REVIEW

A. The Concept of GIS

Geographic information system consists of three terms, namely system, information and geography. The system is a set of components or elements that are interconnected between components / elements to achieve goals. The concept of information is the result of data processing and geography is the study of the Earth's surface. The concept of geographic information system is a collection of components consisting of interacting with each other in data processing so as to produce geographical information that implementation in the form of digital maps. Geographic information systems can also be defined as an information system that can analyze, store, update, integrate and display all forms of information related to the earth's surface. The existence of an efficient geographic information system capable of managing data with complex and large-scale structures can assist in the decision-making process.

There are several reasons why the concepts of geographic information systems and their applications are attractive to use in various disciplines are as follows

- GIS is very effective in assisting the process of forming, developing or improving the map and always coexist with the real-world physical environment filled with visual impressions
- GIS can be used as an interactive, interesting and challenging tool or tutorial in efforts to improve understanding, understanding, learning and education about ideas or concepts of location, space, population, and elements geographical elements present on the surface of the earth and attribute data attached to them.
- GIS uses spatial data and non-spatial data (attributes) in an integrated manner so that the system can answer spatial and non spatial questions
- GIS has the ability to decipher elements on the surface of the earth into layers that can model real shapes on earth
- GIS applications can be customized by using scripting language commands owned by the relevant GIS software so as to meet user needs

automatically, quickly, more attractively, informatively and user friendly.

B. Spatial Data and Non Spatial Data

Spatial data is data that has georeference references where various attribute data are located in various spatial units. Currently spatial data is becoming an important medium for sustainable natural resource development and management planning on continental, national, regional and local coverage. The utilization of spatial data is increasing after the existence of digital mapping technology and its utilization in Geographic Information System (GIS). Spatial data formats can be either vector (polygon, line, points) or raster. In this study using the vector format because the map is a thematic map.

Spatial data is data that has georeference reference where various data Non spatial data or attribute data is data type representing descriptive aspects of phenomenon that modeled, this descriptive aspect includes items or properties of phenomenon concerned to the time dimension.

C. The Concept of Arcview Software

ArcView is one of the desktop Geographic Information System (GIS) software and mapping developed by ESRI (Environmental System Research Institute). With ArcView, users can have the ability to visualize, explore, answer queries (spatial and non spatial databases), analyze data geographically and so on.

The capabilities of these ArcView Geographic Information System (GIS) devices can generally be described below:

- ✓ Data exchange: reading and writing from and into other GIS software formats.
- ✓ Perform statistical analysis and mathematical operations
- ✓ Displays spatial data and attributes
- ✓ Answering spatial queries as well as attributes
- ✓ Perform basic GIS functions
- ✓ Creating thematic maps
- ✓ Customize applications using scripting languages
- ✓ Performs other specialized GIS functions

ArcView organizes the software system, so it can be grouped into several main components as follows

1. Project

Project is the highest organizational unit within ArcView. Projects within ArcView are almost similar to projects owned by other computer programming languages.

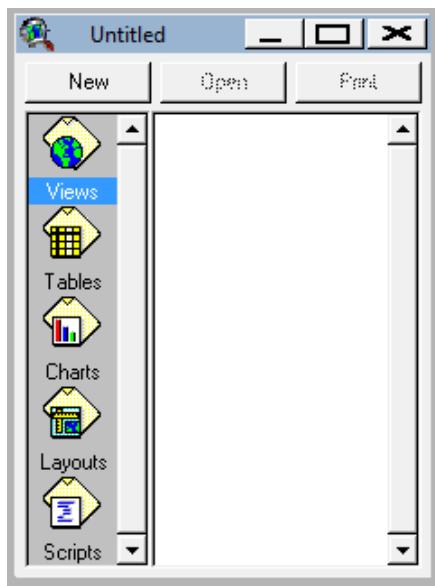

Figure 1. Project Window

2. Theme

Theme is a basic building of the ArcView system and a collection of several ArcView

layers that form a particular theme. Data sources that can be represented as themes are shapefile, coverage (ArcInfo) and raster images.

3. View

View organizes themes. A view is a representation of a spatial information line and can accommodate multiple layers or themes of spatial information (dots, lines, polygons and raster images). For example, city positions (points), rivers (lines) and provincial boundaries (polygons) can form a theme in a view.

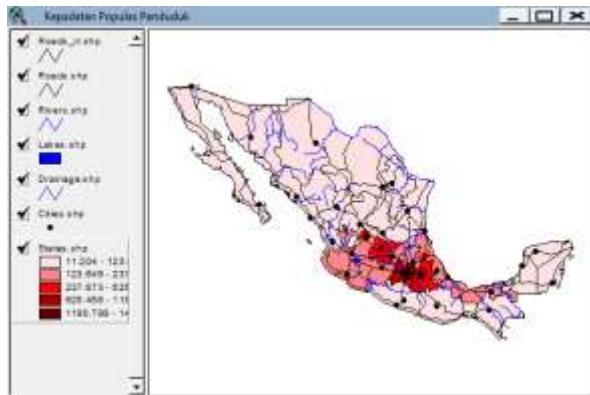

Figure 2. View of some Themes

4. Table

The table is a representation of ArcView data in the form of a table. A table will contain descriptive information about a particular layer. Each data line defines a data entry, whereas each field defines the attribute or characteristics of the corresponding entry.

A screenshot of a Microsoft Windows application window titled "Attributes of States.shp". The window contains a table with the following columns: Shape, Area, Code, Name, Pop7000, Pop90approx, and Pctchange10. The data rows represent Mexican states, showing their names, codes, areas, populations, and percentage changes. The table includes entries for Baja California Norte, Baja California Sur, Nayarit, Jalisco, Aguascalientes, Guanajuato, Querétaro de Arteaga, Hidalgo, Michoacán de Ocampo, México, Distrito Federal, Colima, and Morelos.

Shape	Area	Code	Name	Pop7000	Pop90approx	Pctchange10
Polygon	28002.325	M000	Baja California Norte	1560895	51,537050	90,904620
Polygon	27899.191	M000	Baja California Sur	317764	11,204120	78,254620
Polygon	10547.762	M011	Nayarit	824643	79,198840	62,054950
Polygon	30736.388	M011	Jalisco	9303699	169,943300	81,853420
Polygon	2110.761	M001	Aguascalientes	719059	340,778900	76,521930
Polygon	11715.793	M011	Guanajuato	3982593	338,381600	63,414290
Polygon	4645.565	M022	Querétaro de Arteaga	1051235	237,672300	59,723950
Polygon	8190.684	M011	Hidalgo	1890306	295,052100	44,795700
Polygon	22961.931	M014	Michoacán de Ocampo	3548199	153,387800	61,618700
Polygon	8281.708	M015	México	9815795	1190,799000	84,406950
Polygon	512,050	M000	Distrito Federal	8235744	14426,050000	99,734060
Polygon	2211.033	M008	Colima	428910	213,856600	83,319880
Polygon	1951.676	M012	Morelos	1195059	625,456100	65,621540

Figure 3. Table View inside ArcView

5. Chart

Charts are graphical representations of resumes of data tables and can display query results against a data table. The forms of charts supported by arcView are line, bar, column, xy, scatter, area, and pie.

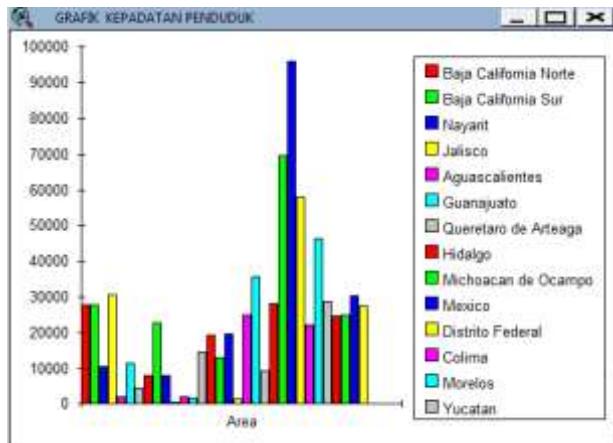

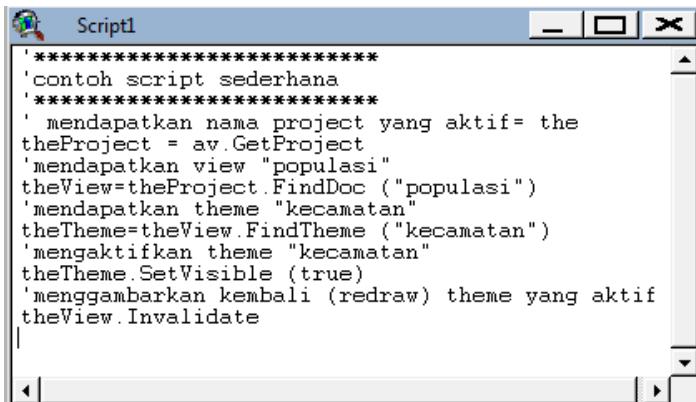

Figure 4. Chart View

6. Layout

Layout is used to combine all documents (view, table, and chart) into a document that is ready to print

7. Script

Scripts are simple (semi) programming languages (macros) used to automate ArcView work. ArcView provides this simple language with avenue. With Avenue, users can modify ArcView's user interface, create programs, simplify complex tasks and communicate with other applications.

```
'*****
'contoh script sederhana
'*****
'mendapatkan nama project yang aktif= the
theProject = av.GetProject
'mendapatkan view "populasi"
theView=theProject.FindDoc ("populasi")
'mendapatkan theme "kecamatan"
theTheme=theView.FindTheme ("kecamatan")
'mengaktifkan theme "kecamatan"
theTheme.Visible (true)
'menggambarkan kembali (redraw) theme yang aktif
theView.Invalidate
```

Figure 5. Display of Scripts Language in ArcView

ArcView customizes the project along with the available tools into windows, menu buttons, and icons. All interactions with users are done within this area. Every document type (view, table, chart, layout and script) ArcView has a different GUI (Graphical User Interface).

ESRI has developed several versions of ArcView, used in this research is ArcView version 3.2. ArcView 3.2 software is a software that is one of the utility for editing, digitization, layout of satellite image map. This software runs under a desktop mapping system by providing a framework for spatial decision making, and

has the ability to describe, investigate, and evaluate, query and analyze spatial data. Jobs change map symbols, add image or graphic images, create map information. Acview software can change the icons or terminology used on the interface, automate operations or create a specific interface to access the basic data terentu. Besides this ArcView Software can also communicate with other software products where it can replace without doing the conversion and exit from ArcView.

D. The Concept of Map

Map is a depiction of the surface of the earth that is projected onto a plane with a certain scale.

Function and purpose making the map :

1. Shows the relative position or location on the face of the earth
2. Shows the size (width, distance) on the face of the earth
3. Describe the shape of the face of the earth
4. Presenting potential data of a region
5. Communication of space information
6. Save information
7. Assisting the job (road construction, navigation, planning)

8. Analysis of spatial data (volume calculation)

Types of maps by Data Type are Topographic Map, Thematic Map, based on the scale is Cadast Map (1: 100 to 1: 5.000), Large Scale Map (1: 5.000 until with 250,000), Medium Scale Map 1: 250.000 up to 1: 500.000), Small Scale Map (1: 500.000 until with 1: 1.000.000), Geographic Scale Map (> 1: 1.000.000).

Map components, Map Scale, Legend, Orientation, Symbols, Source and manufacture and Projection. Map analysis is an attempt to analyze the information displayed on the map. Examples include counting slopes, calculating volumes, determining patterns and drainage densities, analyzing vegetation patterns, analyzing patterns of settlement distribution. Map Interpretation is an effort to analyze the map associated with other sources of information, for a purpose. For example, if a region on the map has a rectangular drainage pattern, it can be predicted that the ground surface of the area is flat, and composed of soft rocky surfaces. Map Projection is an attempt to move parallel lines and meridians from the curved plane to the flat plane.

E. The Concept of Layer

Layer is a layer in the spatial data generation, this layer aims to group the same data to facilitate the data manipulation. The types of layers in the data vector consists of 3 types: the point represents the city, the capital, the tourist object, the place of worship and so on, the line represents the river, the boundary of the territory, the railway line, the transportation route and so on while polygon represents lakes, regions and so forth. Here's an overview of the layer.

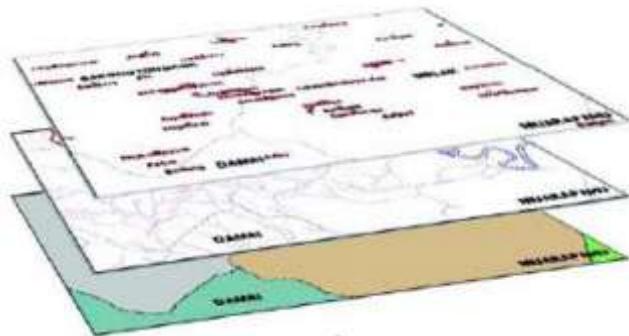

Figure 6. Layer Image

F. Definition of Higher Education in Indonesia

Higher Education is a continuation of secondary education held to prepare learners to become members of the community who have academic and professional ability who can apply, develop and create science, technology and art

Higher Education are educational units of higher education providers. Students are called college students, while college educators are called lecturers.

By type, colleges are divided into two:

- State higher education are universities organized by the government.
- Private higher education are private universities. These education are managed by Private Legal Entities & under the coordination of Kopertis of each region.

According to the level of his position, private higher education are divided into 3 statuses, namely:

1. Higher education with registered status are valid for a period of 5 years.
2. Higher education with a recognized status is valid for a period of 4 years.

3. Higher education with equal status shall be valid for a period of 3 years

Higher education is education at a higher level than middle school education in education.

Higher education objectives are:

1. Preparing learners to become members of the community who have academic and professional skills who can apply, develop and create science, technology and art.
2. Develop and disseminate science, technology and art as well as optimize its use to improve people's living standards and enrich national culture

In Indonesia, higher education can take the form of academy, institute, polytechnic, college, and university. Higher education can provide academic, professional, and vocational education with diploma education programs (D1, D2, D3, D4), undergraduate (S1), master (S2), doctoral (S3), and specialist degrees. Universities, institutes, and colleges with doctoral programs are entitled to award honorary doctorates to honorable individuals with respect to outstanding services in the fields of science, technology, society, religion, culture

or art. The name of a professor only used during the relevant work is still active as educators in college.

Management and regulation of higher education in Indonesia conducted by the Ministry of National Education. Rector of State higher education is an echelon official under the Minister of National Education. In addition, there are also higher education run by ministries or non-ministerial government institutions which are generally official colleges, such as State higher education of Accountancy run by the Ministry of Finance. Furthermore, under applicable law, every higher education in Indonesia must have an Education Legal Entity that serves to provide fair and quality services to students, principled nonprofit, and can manage funds independently to advance national education.

Here is an explanation of the type of higher education in Indonesian Country :

➤ Academic

The Academy (Greek language) is an institution of higher education, research, or honorary membership. The name is derived from Plato's philosophical school founded

around circa 385 BC at Akademia, an Athenian sanctuary, goddess of wisdom and ability, north of Athens, Greece. Academy in education in Indonesia is one form of college other than polytechnics, high schools, institutes, and universities. Academy is a college that organizes vocational education in one branch or part of a particular branch of science, technology, and / or artInstitut menyelenggarakan program pendidikan akademik dan/atau profesional dalam sekelompok disiplin ilmu pengetahuan, teknologi dan/atau kesenian yang sejenis. Memberikan pendidikan dan pengajaran tinggi serta melakukan penelitian dalam beberapa cabang ilmu pengetahuan sejenis. Institut dipimpin oleh seorang rektor

➤ Polytechnic

The type of higher education that conducts vocational education in the number of specialized knowledge areas. In its position as a higher education, the Polytechnic is part of the national education system which means

students become members of the community who have the ability that can be used, develop and develop science and technology and strive for the use to improve the living standards of healthy people and humans enrich national culture. Polytechnics are professional education that calls for the readiness to apply certain skills. In addition, the Polytechnic is a college that conducts applied education in various fields. To achieve this goal, the Polytechnic provides the perfect learning and training experience for camping in science and technology with 70% practice and 30% practical theory. His graduates hold an Associate degree (A.Md) earned a degree of Expert Madya (A.Md) who is ready to work thanks to training and practical theory during education.

➤ College

College provides high education and teaching and conducts research in one branch of science. College is led by the Head of College.

➤ Universitas

Universitas adalah lembaga pendidikan tinggi dan penelitian, yang memberikan gelar akademis dalam berbagai mata pelajaran. Universitas adalah perusahaan yang menyediakan pendidikan sarjana dan pendidikan pascasarjana. Kata universitas berasal dari bahasa Latin universitas magistrorum et scholarium, kira-kira berarti "komunitas guru dan peneliti.

Universitas yang dipimpin oleh seorang rektor terdiri dari beberapa fakultas dan masing-masing fakultas terdiri dari beberapa jurusan dari berbagai bidang ilmu.

3. IMPLEMENTATION

In this section discusses the identification of spatial data consisting of the result of digitized map of Bali Island in Arcview GIS and digitized results of each district or municipality. The second discussion is the identification of non spatial data and the integration of spatial data and non spatial data and in this chapter also described the results of the analysis of this study.

A. Identification of spatial data

Spatial data consists of data of all districts / municipalities in Bali Island, data of college location in each regency / municipality in Bali Island, data of capital of each regency / municipality. Here is the result of digitized map of Bali island.

Result of Digitasi Peta Bali Island use ArcView GIS

Digitization is the process of drawing maps from manual to digital. Digitization process is by identifying the layer to be created. Layers are layers with the aim of grouping the same data so that it is easily manipulated. The first layer is a layer with polygon type feature to store spatial data of the islands of Bali (* shp). The second layer is the district / municipality layer and is

equipped with the name of each region. The result of digitization can be seen in figure 8.

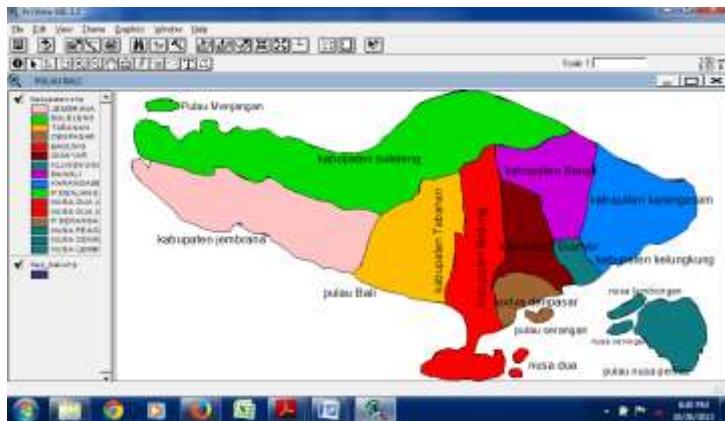

Figure 7. Result of Digitation Map of Bali Island

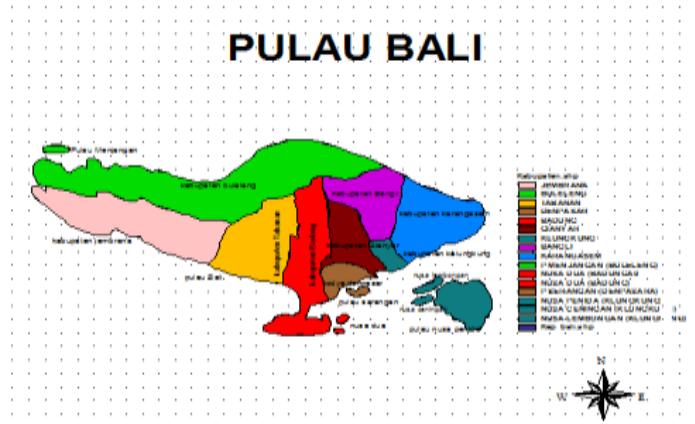

Figure 8. Map Layout Bali Island

In figure 9 is the layout of the map of Bali Island is a general picture of the overall digitasi results from the island of Bali before printing to the output tool.

Digitasi Regency / Municipality of Bali Province

The spatial data of Bali Island are grouped into 8 districts and 1 municipality. Here is a picture of the results of digitasi 8 kabupaten and 1 municipality in Bali Island

Result of Digitation of Jembrana Regency

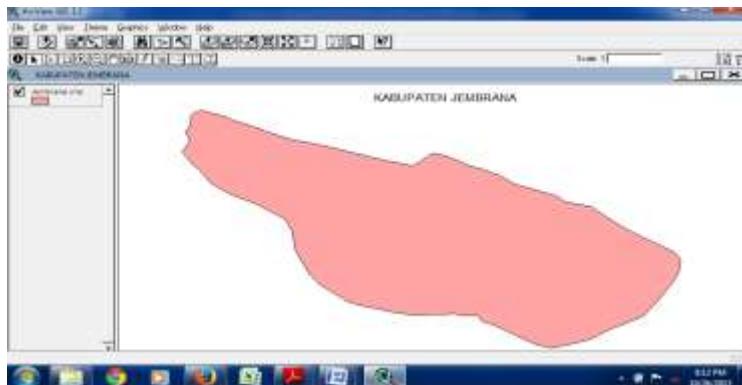

Figure 9. Result of Digitation of Jembrana Regency

Result of Digitation of Buleleng Regency

In figure 10 is the result of digitized map from Buleleng Regency which consists of 1 layer whose feature type is polygon. At the time of digitasi formed 2 records of

spatial data islands and spatial data buleleng. The island is a land area including Buleleng district.

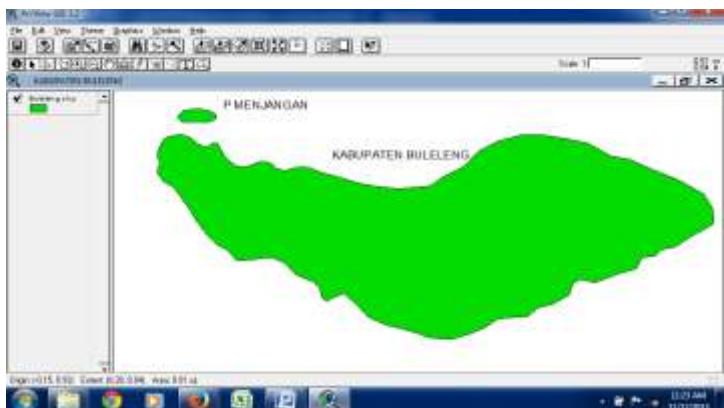

Figure 10. Result of Digitation of Buleleng Regency

Result of Digitation of Tabanan Regency

Figure 11 is the result of digitized map of Tabanan Regency which consists of 1 layer whose feature type is polygon.

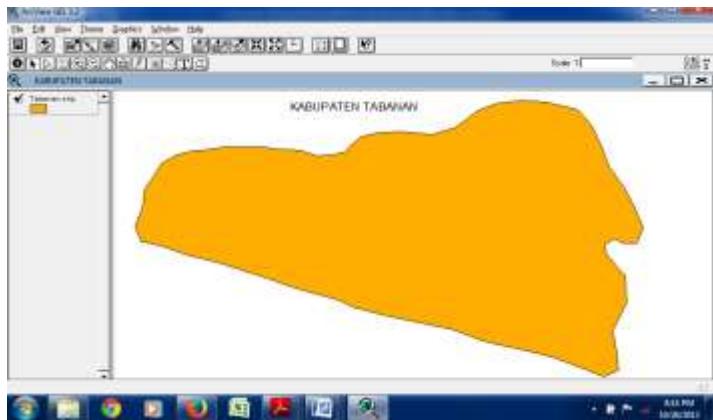

Figure 11. Result of Digitation of Tabanan Regency

Result of Digitation of Badung Regency

Figure 12 is the result of digitized map of Badung regency consisting of 1 layer whose feature type is polygon. At the time of digitization formed 3 records of spatial data of two islands (2 records) and spatial data of Badung. Nusa Dua Island is an area including Badung regency.

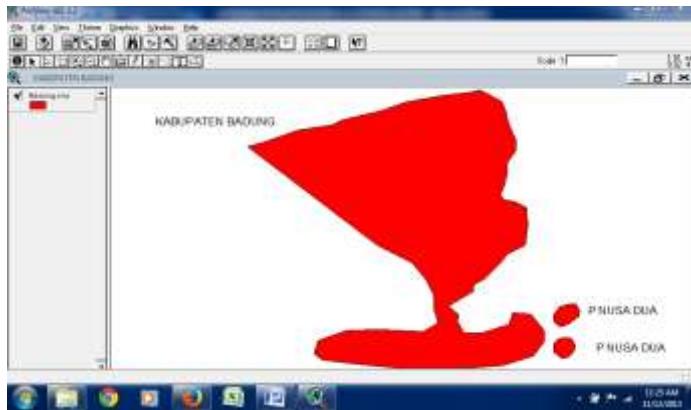

Figure 12. Result of Digitation of Badung Regency

Result of Digitation of Gianyar Regency

Figure 13 is the result of digitized map of Gianyar Regency which consists of 1 layer whose feature type is polygon.

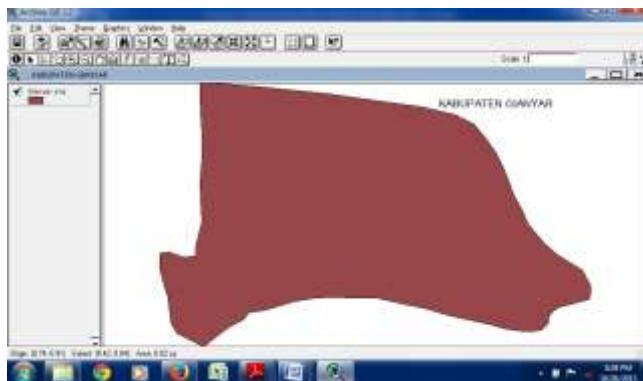

Figure 13. Result of Digitation of Gianyar Regency

Result of Digitation of Bangli Regency

Figure 14 is the result of digitized map of Bangli Regency which consists of 1 layer whose feature type is polygon.

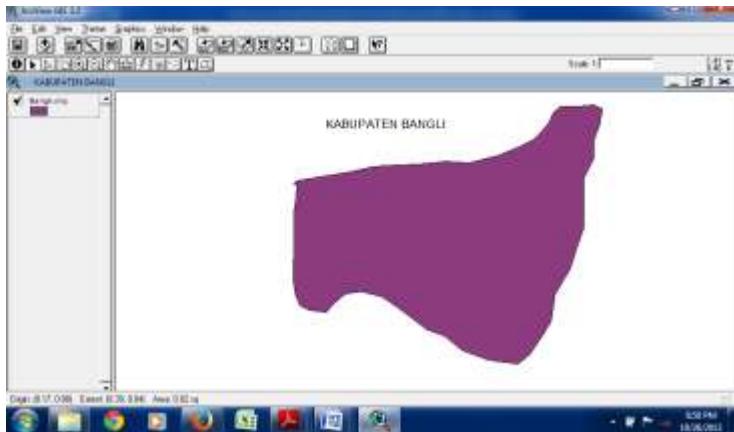

Figure 14. Result of Digitation of Bangli Regency

Result of Digitation of Klungkung Regency

Figure 15 is the result of digitized map of Klungkung regency consisting of several islands namely nusa penida, nusa ceningan, nusa lembongan and nusa penida. feature type layer is polygon.

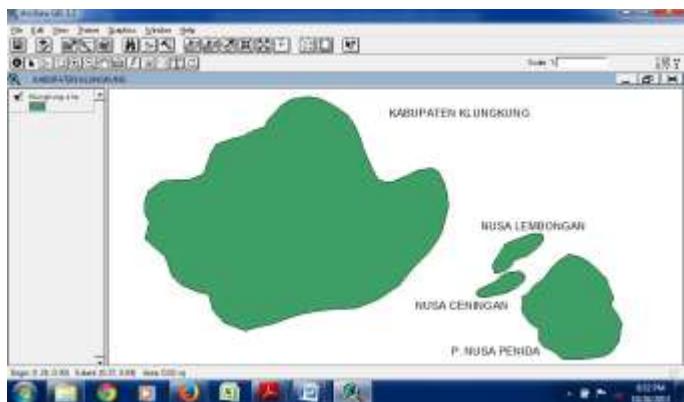

Figure 15. Result of Digitation of Klungkung Regency

Result of Digitation of Karangasem Regency

Figure 16 is the result of digitized map of Karangasem Regency which consists of 1 layer whose feature type is polygon

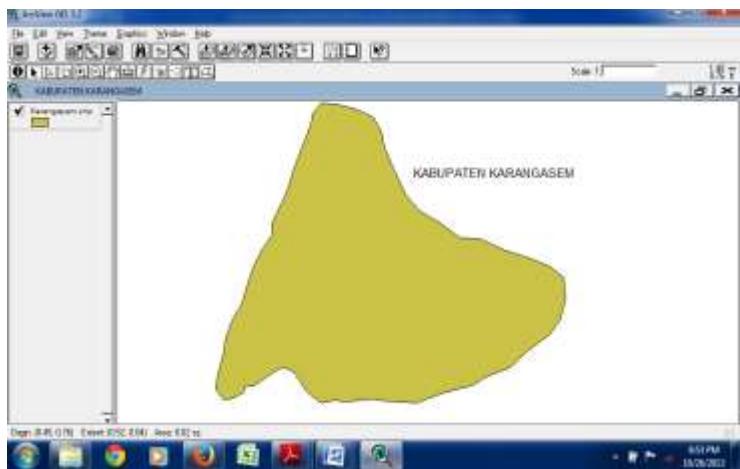

Figure 16. Result of Digitation of Karangasem Regency

Result of Digitation of Denpasar Municipality

Figure 17 is the result of digitized map of Denpasar Municipality which consists of 1 layer whose feature type is polygon. At the time terbitasi terbentu 2 records of attack island and the area of Denpasar

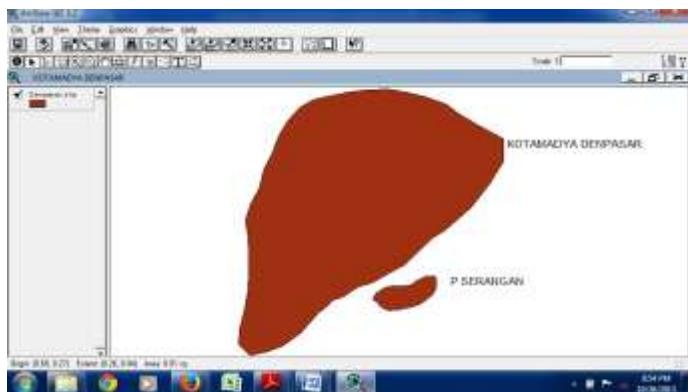

Figure 17. Result of Digitation of Denpasar Municipality

B. Identification of Non Spatial Data

Here is a picture of the data described by using ERD (Entity Relationship Diagram). In making this diagram, the first step is to identify the entity (object), the second step is the identification of each attribute and the third step is the identification of relations between objects.

Entity (object) in this research is as follows:

Table 1. Entity and Attribute

15	Klungkung	Klungkung	Smarapura
16	Karangasem	Karangasem	Amlapura

Higher education data are grouped into 5 : university, institute, polytechnic, academy and college. Here is an explanation of each college.

Grouping of College on the Island of Bali

College data on the island of Bali are grouped by regency in Bali Island, can be seen in appendix. Appendix 1 lists the existing high schools throughout

the island of Bali consisting of the names of high schools, disciplines, the number of majors, the status of the public or private college, the location of the college. Appendix 2 contains about majors from each complete with majors and majors status. The grouping of college by district is found in appendices 31 through 39. The results of high school groupings in each district are listed in the following table:

Table 3. Results Grouping of College on the Island of Bali

No	Name Regencies/ Municipalities	Amount College
1	Buleleng	1
2	Jembrana	1
3	Tabanan	1
4	Badung	3
5	Denpasar	8
6	Bangli	1
7	Gianyar	0
8	Klungkung	0
9	Karangasem	0

In table 3, the most dominant location is the college is Denpasar, still centered in the capital. The spread of college has not been evenly distributed to other districts and there are districts that do not have college.

Grouping of Universities on the Island of Bali

The data on the classification of the name of the university are contained in appendix 3. The groupings of the faculties of each university are contained in appendix 4 and the grouping of departments of each faculty is found in appendix 5. The grouping of universities by district is in appendix 13-21. Here is a table of observations of the number of universities in each district

Table 4. Results of Grouping of Universities on the Island of Bali

No	Name Regencies / Municipalities	Amount universities
1	Buleleng	2
2	Jembrana	0
3	Tabanan	1
4	Badung	2
5	Denpasar	7

6	Bangli	0
7	Gianyar	0
8	Klungkung	0
9	Karangasem	0

In table 4, the most dominant location of the university is Denpasar Municipalities as well as 7 private universities are still concentrated in the capital. The distribution of universities has not been evenly distributed to other districts and there are districts that do not have universities.

Grouping of Institutes on the Island of Bali

Data on grouping of institute type names of colleges are on appendix 8. Grouping of faculty of each institute is found in appendix 9 and classification of departments of each faculty is found in appendix 10. Grouping of institutes by district is in appendix 22-30. Here is a table of observations of the number of institutes of each district.

Table 5. Results Grouping Institute on the Island of Bali

No	Name Regencies / Municipalities	Amount institute
1	Buleleng	0
2	Jembrana	0
3	Tabanan	1
4	Badung	0
5	Denpasar	3
6	Bangli	0
7	Gianyar	0
8	Klungkung	0
9	Karangasem	0

Based on the observations in table 5, the most attended location is the institute is Denpasar municipalities as much as 3 institutes, still concentrated in the capital. The spread of the institute has not been evenly distributed to the districts.

Grouping of Polytechnic on the Island of Bali

Data on the classification of tertiary-level polytechnics are listed in annex 6. Grouping of majors are listed in appendix 7. Grouping of institutes by district is in

appendix 49-57. Here is a table of observations on the number of polytechnics of each district.

Table 6. Results Grouping Polytechnic on the Island of Bali

No	Name Regencies / Municipalities	Amount Polytechnic
1	Buleleng	1
2	Jembrana	0
3	Tabanan	1
4	Badung	1
5	Denpasar	2
6	Bangli	0
7	Gianyar	0
8	Klungkung	0
9	Karangasem	0

Based on the observation in table 6, the most polytechnic location is Denpasar : 2 private polytechnic, still centered in the capital city. The spread of the institute has not been evenly distributed to the districts.

Grouping of Academic on the Island of Bali

The data on the categorization of higher education of various academies are found in appendix 11. The grouping of majors is listed in appendix 12. The grouping of academies by district is contained in appendix 40-48. Here is a table of observations on the number of academies of each district.

Table 7. Results Grouping Academic on the Island of Bali

No	Name Regencies / Municipalities	Amount academic
1	Buleleng	0
2	Jembrana	0
3	Tabanan	0
4	Badung	1
5	Denpasar	9
6	Bangli	1
7	Gianyar	0
8	Klungkung	0
9	Karangasem	0

Based on the observations in table 7, the most dominant location of the academy is Denpasar municipalities : 9

private academies, still centered in the capital. The distribution of the academy has not been evenly distributed to the districts.

C. Integration Data Spatial with Data Non Spatial

In the section explained on the integration of spatial data and spatial data in each regencies / municipalities on the island of Bali

Integration Data of Higher Education in Buleleng Regency

Spatial data and non spatial data that have been identified in Buleleng district can be implemented in arcview. Spatial data consists of 4 layers namely Layer singaraja city to store data atribu / non spatial description of singaraja city, layer of college used to store non spatial data of college spreading in Buleleng Regency. The street layers are used to store data about the roads associated with the college location. Here is the view of college map in Buleleng District that has been integrated between spatial data with non spatial data.

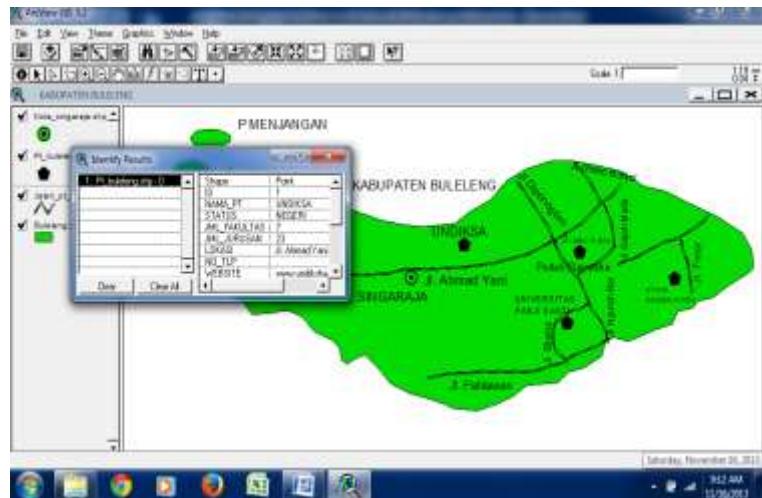

Figure 19. The Map of Distribution of Higher Education in Buleleng Regency

The non-spatial data will be stored in the table in ArcView. The picture of the table is as follows

Point	ID	NAME_PT	STATUS	JLN_ALAMAT_PT	JLN_ALAMAT_PT	LONGITUDE	LONGITUDE	WEBSITE	WEBSITE
Point	1	UNDERSA	NEGERI	7	23.1. Ahmad Yani IV Segara	115.210200	115.210200	www.undesa.ac.id	P121 Bahasa dan

Figure 20. Non spatial data on Higher Education Layer in Buleleng

In figure 20. Shows the integration between spatial data of location / location of higher education with non spatial data containing attributes of each higher education.

Integration Data of Higher Education in Jembrana Regency

The integration of spatial and non spatial data on the map of higher education in Jembrana regency is important in the concept of Geographical Information System. Here is a picture of the result of digitization and integration between spatial data and non spatial data in Jembrana Regency.

Figure 21. The Map of Distribution of Higher Education in Jembrana Regency

The results of identification of spatial data that have been integrated can be seen in Figure 21.

ID	Nama PT	Alamat	Kota/Kabupaten	Lokasi	Lokasi Z.
1	STI ILMU TEKNIK JEMBRANA TAWASTA	Jl. Aji Jendral Sudirman Kelapa, II	Jembrana	108450	108500

Figure 22. Non spatial data on Higher Education Layer in Jembrana

After doing research it turns out there is only 1 higher education found in Jembrana Regency.

Integration Data of Higher Education in Tabanan Regency

Setelah diidentifikasi data spasial dan data non spasial maka data tersebut dapat diimplementasikan ke dalam ArcView dan diintegrasikan ke dalam aplikasi. Pada ArcView data spasial dikelompokkan dalam 3 layer yaitu layer perguruan tinggi di kabupaten Tabanan, layer jalan untuk menunjukkan lokasi perguruan tinggi dan layer wilayah yang menyimpan digitasi wilayah kabupaten Tabanan. Gambar Berikut adalah Data spasial Kabupaten Tabanan lengkap dengan layer.

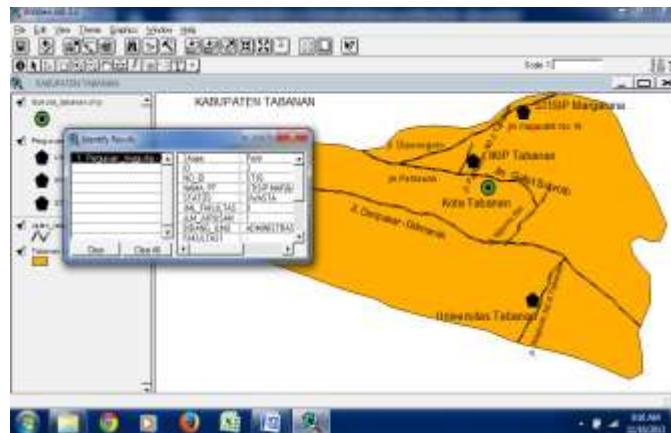

Figure 23. The Map of Distribution of Higher Education in Tabanan Regency

In the higher education layer, non spatial data in Tabanan Regency there are 3 universities namely Tabanan University, Saraswati Tabanan IKIP and STISIP Margarana Tabanan. The road layer contains location attribute data from each college. Below is the non-spatial data that exists in the table in ArcView.

Point ID	No. PT	NAMA PT	STATUS	JENJALITAS	JENJURUSAN	SEGARANG	FAKULTAS	FAKULTAS2
Point 1	1 08	UNIVERSITAS TABANAN	SWASTA	3	3	-	FAK-EKONOMI	FAK-EKONOMI

Figure 32. Non spatial data on Higher Education Layer in Bangli Regency

Based on figure 32, in Bangli Regency there is 1 college with private status named STIKIP Suar Bangli.

Integration Data of Higher Education in Karangasem Regency

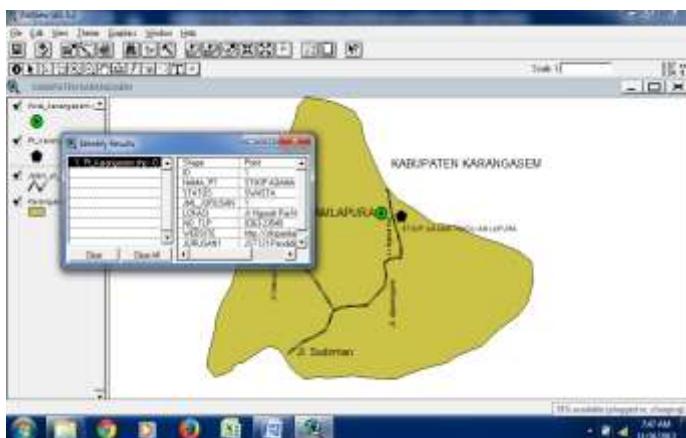

Figure 33. The Map of Distribution of Higher Education in Karangasem

Figure 33 is a map of spatial data integration and non spatial distribution of higher education in Karangasem Regency. When clicked point then appears dialog box containing information about the higher education.

4. DISCUSSION

After the research on the spread of universities in the island of Bali it can be described the results of research discussion as follows :

1. Pada proses pengelompokan perguruan tinggi (PT) berdasarkan kabupaten di Pulau Bali maka Kabupaten Buleleng terdapat 4 perguruan tinggi, kabupaten Jembrana terdapat 1 perguruan tinggi, Tabanan terapat 3 perguruan tinggi, Badung terdapat 6 PT, Bangli terdapat 1 PT, Gianyar tidak ada PT, Karangasem terdapat 1 PT, Denpasar terdapat 25 dan klungkung tidak ada PT yang dibangun. Berikut adalah grafik jumlah perguruan tinggi berdasarkan kabupaten yang ada di Pulau Bali
In the process of grouping colleges (PT) based on the districts in the island of Bali Buleleng regency there are 4 higher education, Jembrana regency there is 1 higher education, Tabanan terapat 3 higher education, Badung there are 6 higher education, Bangli there is 1 higher education, Gianyar no there are higher education , Karangasem there are 1 higher education, Denpasar there are 25 higher education and klungkung no there are higher education built.

Here is a graph of the number of higher education based on the existing regency on the island of Bali

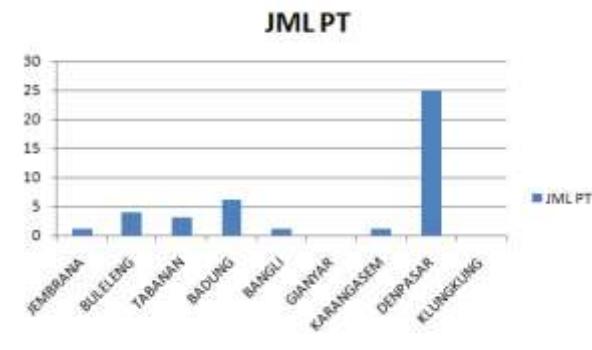

Figure 34. Graphic Number of Higher Education on the Island of Bali

Based on the graph of drawing 34 it can be concluded that in the city of Denpasar the most built public higher education that private or the state and there are other regency that have not yet built higher education such as Klungkung and Gianyar regency resulting in educational gap.

2. Subsequent groupings by type of higher education in each regency complete with faculty, department and accreditation. The types of higher education are grouped into 5 : universities, institutes,

polytechnics, colleges and academic. Here is a table of the number of types of higher education in each regency.

Table 8. Number of Higher Education by Their Type

Regency	Amount of Higher Education				
	Universities	Institute	Polytechnic	College	Academic
Jembrana	0	0	0	1	0
Buleleng	2	0	1	1	0
Tabanan	1	1	0	1	0
Badung	2	0	1	2	1
Bangli	0	0	0	1	0
Gianyar	0	0	0	0	0
Karangasem	0	0	0	1	0
Denpasar	7	3	2	6	7
Klungkung	0	0	0	0	0

From the results of these observations, then the analysis of the number of higher education in each regency by type. Here is a graph of the number of types of higher education in each regency.

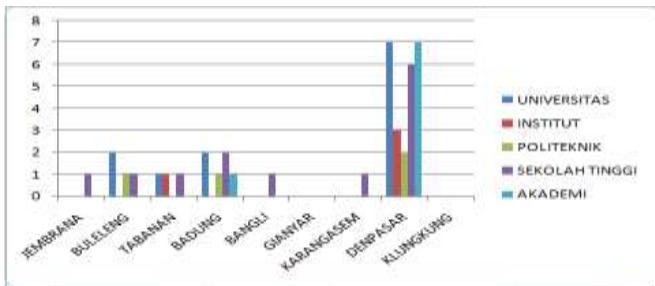

Figure 35. Graph Amount of Higher Education by Type

Based on the graph of figure 35 it can be concluded that the highest number of universities, institutes, polytechnics, college and academies are in the Denpasar regency / municipality. The capital of Bali still dominates the highest number of types of higher education. At the university which has the most number of faculty is Udayana University with state status. In the type of polytechnic that has many majors is the polytechnic of Bali, for the academy is the tourism academy of Denpasar and for the institute is ISI Denpasar and for high school is ST Foreign Language Saraswati.
